Title : Tentative Classification of Tars of Coke-Byproducts
Plants

Orig Pub: Koks, smola, gaz, 1956, 1, No 3, 103-107

Abstract: A processing of analytical data relating to the
tars of Polish coke-byproducts plants has made
it possible to trace a correlation between the
specific gravity of the tar and such parameters
as its content in pitch, free carbon, anthracene

Card 1/3

and phenols (in the fraction up to 270°), and also certain relationships between the contents of free carbon and pitch, between specific gravity of the tar and the content of benzene and toluene in the crude benzene, between the benzene and toluene content of crude benzene. All these correlations represented in the form of diagrams have provided a basis for classifying the tars derived from Polish coke in two groups, of specific gravity below and above 1.195, pitch content (in %) below and above 63, free carbon below and above 9, phenols (up to 270°) below and above 2, crude anthracene below and above 2.5.

To improve the operation of tar fractionation plants it is recommended to group the tars produced by various coke byproducts plants in accordance with these two subdivisions and to specialize accordingly the methods of their processing.

Thermal Refining of Coal. Measurements and Method
of Calculation of Dynamic Viscosity.

Orig Pub: Koks, smola, gaz, 1957, 2, No 5, 188-191.

Abstract: Dynamic viscosities of various coal products (raw, refined, and motor gasoline, toluene fraction, refined xylene, solvent naphtha etc.) at different temperatures were determined. For graphical representation of the effect of temperature on viscosity the Duhring's Rule was used. Applicable formulae for calculation are presented.

Title : New Raw Material for the Manufacture of Phthalic Anhydride.

Orig Pub: Chemik, 1957, 10, No 11, 317-321.

Abstract: In the manufacture of phthalic anhydride (I) naphthalene (II) is normally used. The world production of I in 1957 (excluding the peoples' democracies) was approx. 340,000 tons, which would be equivalent to 420,000 tons II at the world's production rate of 432,000 tons of the latter. Because of shortage of II, its substitutes are being sought. Exploratory research was conducted whose

Card 1/5

Commercial Organic Synthesis.

Abs Jour: Ref Zhur-Khimiya, 1958, No 20, 68306.

Abstract: object was to derive I from the components of coal tar, hitherto not used for the purpose. The coal tar contains approximately 7.5% II. The investigation covered oxidation of the products containing 0.6-5.0% of II. This was done in the presence of a catalyst (C) - containing fused V₂O₅, 80% of which was in a form of 4.5-7.5mm granules and 20% in the form of 7.5-10mm granules. Thus from phenanthrene (III) 72% yield of a product containing 85-90% I and 10-15% maleinic anhydride (IV) was obtained at 450° and at an air rate of 20 l/gr of III. The optimum contact time being 1.4-2.6 sec.

Card 2/5

POLAND / Chemical Technology. Chemical Products.
Commercial Organic Synthesis.

H

Abs Jour: Ref Zhur-Khimiya, 1958, No 20, 68306.

Abstract: In the oxidation of anthracene (V), anthraquinone is produced alongside with I and IV, with the yield of 85-92%. At a temperature of $> 450^\circ$, I is the main product. In the oxidation of fluorene, 80% I and IV are produced with the yield of 68%. From chrysene (at 6.3 minutes contact time) there were obtained 89% I and 11% IV with the yield of 87.6%. A possibility of obtaining I by means of oxidation of fractions from the initial fractionation of coal tar was checked. From the phenanthrene fraction containing 50% III and 14% V the products of oxidation constituted 46.9 wt % of which 32% was I. When the products of oxidation were recalculated based on III the yield was 112% of which I was 85%, i.e., it was greater than in the oxidation of II.

Card 3/5

51

POLAND / Chemical Technology. Chemical Products.
Commercial Organic Synthesis.

H

Abs Jour: Ref Zhur-Khimiya, 1958, No 20, 68306.

Abstract: Anthraquinone was obtained simultaneously from V with 62.7% yield. The anthracene fraction yields 23-34.4% of products (212-290% based on III) that include 13.8-22.5% I. The naphthalene fraction, contained 79.8% II, upon oxidation gives 89.7% anhydrides that include 79% I. Capacities of C basis maximum yields comprise 120 gr/l/hour for II, 30-35 gr/l/hour for III, V, and fluorene, 40 gr/l/hr. for chrysene and pyrene, and 50-55 gr/l/hr. for phenanthrene and anthracene fractions. Decrease in the conversion increases capacity of the catalyst C considerably. Activity of C has not

Card 4/5

TITLE: High energy behavior of the real part of a charge-exchange amplitude *B*

SOURCE: Acta physica polonica, v. 27, no. 6, 1965, 989-991

TOPIC TAGS: charge exchange, scattering amplitude, strong nuclear interaction, asymptotic property *19, 55*

ABSTRACT: The high-energy behavior of the real part of the charge-exchange amplitude is considered by making use of results of Meiman (N. N. Meiman, Zh. Eksper. Teor. Fiz. v. 43, 2277, 1962), using also the Phragmen-Lindelof theorem. The communication is essentially devoted to an estimate of the rate of decrease of the real part of the amplitude and the degree of its compatibility with the analyticity and unitarity conditions. Orig. art. has: 8 formulas.

AUTHOR: Witek, J., Captain-navigator

TITLE: The method of interception of a target at low altitude

PERIODICAL: Wojskowy przeglad lotniczy, no. 4, 1961, 18-24

TEXT: In this article the author describes one of the methods of intercepting a target in the air at low altitudes by application of a half-loop dive or of a half-roll. Decisive for the successive performance of this operation is an accurate calculation of the point at which the diving operation should commence and its distance, "S_w", from the oncoming target. The exact location of this point is calculated by the navigator, who takes into consideration the speed of both aircraft, the angle of approach and the time needed for completion of the loop dive maneuver. For opposite courses of both aircraft or courses mutually intersecting at angles not greater than 60°, the following formulas are recommended: (1) without taking into account the loss of time caused by giving the "go-ahead" order and

The method of interception...

its accomplishment, $S_w = V_c \times t_p$; (2) when taking the above-mentioned loss of time into account $S_w = V_c(t_p + t_o) + (V_m + V_c)t_o$ where V_c = the speed of the target, V_m = the speed of the interceptor plane at the point at which the loop-dive maneuver starts, t_p = the time needed for loop-dive completion, t_o = the time lost for giving the order and its execution. For courses mutually intersecting at angles between 60° and 90° , and including the loss of time for giving the order $S_w = V_c(t_p + t_o)$. About 20 - 30 seconds before the interceptor plane will be at the maneuver starting point, suitable warning is given. For intercepting the target while on patrol the half-roll maneuver is recommended. There are 4 figures and 2 tables.

"Concentration of Hydrogen Ions and Reserve of Bases in Blood of Patients Undergoing X Ray Treatment."

Warsaw, Postepy Higieny i Medycyny Doswiadczałnej, Vol 17, No 1-2, 63, pp 229-233.

Abstract: Authors report details of an investigation which revealed, in most cases, caused a temporary decline in the base reserve of the blood without affecting its pH. In these patients symptoms of irradiation poisoning were either totally absent or very mild. Acidity was connected with symptoms of poisoning, appeared to depend more on the individual reaction of the patient than on the dose or duration of the treatment, and may possibly be more frequent in treatment of the abdominal cavity than of the upper part of the body. Passing acidity between determinations cannot be excluded. 2 Polish and 7 Western sources in the German language.

| ORIG. PUB. | : Przeglad Papiern., 15, No 4, 97-101 (1959) | |
| ABSTRACT | : The analysis was made by the method of fractional distillation on nearly completely dewatered material. The presence of n-propyl and the absence of isopropyl alcohol and of camphor was noted. The processing of the waste liquors must be preceded by removal of sulfur compounds. For the preceding communication in this series see RZhKhim, 1959, No 8, 29090. | |

✓ Compounds of arsenious oxide with strong alkali halides.
I. Cryometric measurements. Edward Józefowicz and
Tadeusz Witek (*Inst. Technol., Politech. Warszawski Chem.-Chim.*, 21, 1-3 (1956) (English summary).--The b.p. lowering of the following ars. solns. was detd.: As₂O₃(I) (up to over 25 g. per kg. H₂O), KCl (up to over 2 molal), KBr (up to 1.3 molal), KI (up to 1.3 molal), NaCl (up to 2 molal), NH₄Cl (up to 1.3 molal), and finally of mixed solns. contg. I and each of the above salts in various proportions. In solns. with NaCl and NH₄Cl the observed drop, Δ_t , could be calcd. additively from their compn., whereas solns. with all 3 K halides showed marked neg. deviations from additivity. These deviations were considered evidence for complex formation between the solutes. II. Ebulliometric measurements. Edward Józefowicz and Zdzisław Gałecki. *Ibid.* 283 S.--The b.p. elevation of the following solns. was detd.: As₂O₃(I) (up to over 18 g. per 1 kg. H₂O), KCl (up to 4.5 molal), KBr (up to 3.5 molal), NaCl (up to 4 molal), NH₄Cl (up to 5 molal) as well as of solns. contg. I and each of the above salts in various proportions. In all cases the b.p. elevation could be calcd. additively from the compn., within a exptl. error. This was considered evidence of complete decompr. at the b.p. of complexes formed by I with some of the K halides.
